

Moisture-swing polymer@textile composite membranes for CO₂ capture

Maren Thompson, Dr. Marlene Velazco Medel, Dr. Matthew Green*

Chemical Engineering, Arizona State University

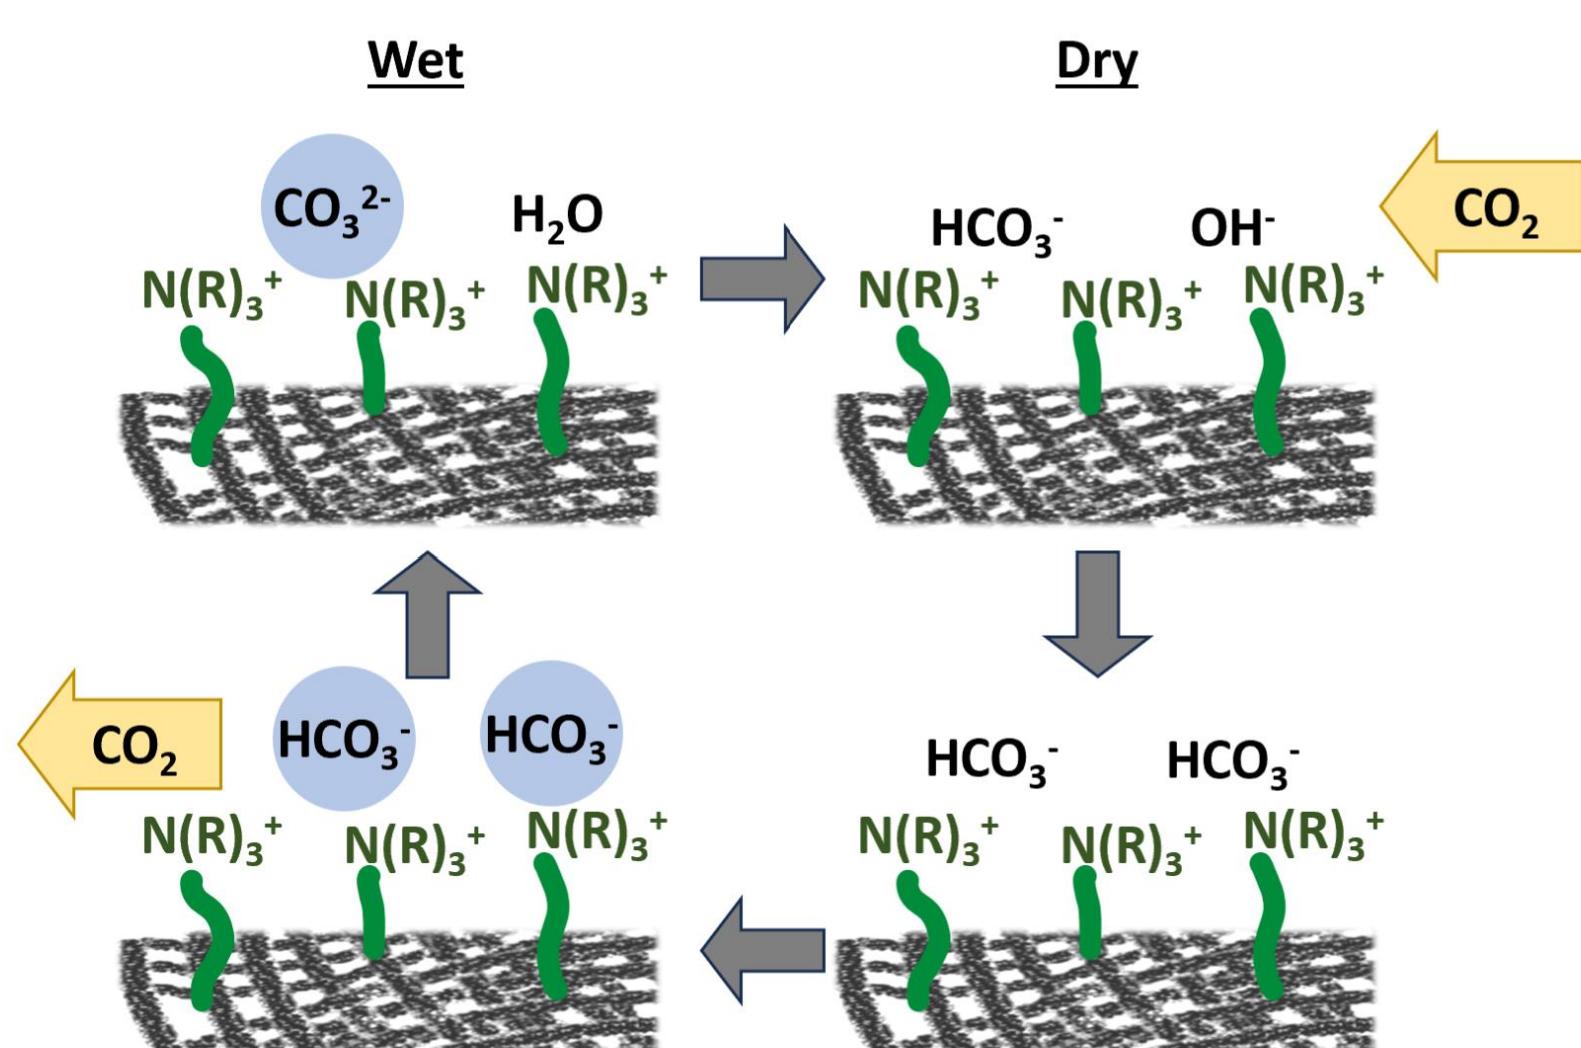

Motivation

- EPA estimates textiles made up 5.8% of municipal solid waste in 2018, of which only 14% was recycled.
- Moisture-swing Direct Air Capture (DAC) requires sorbents with long-term stability.

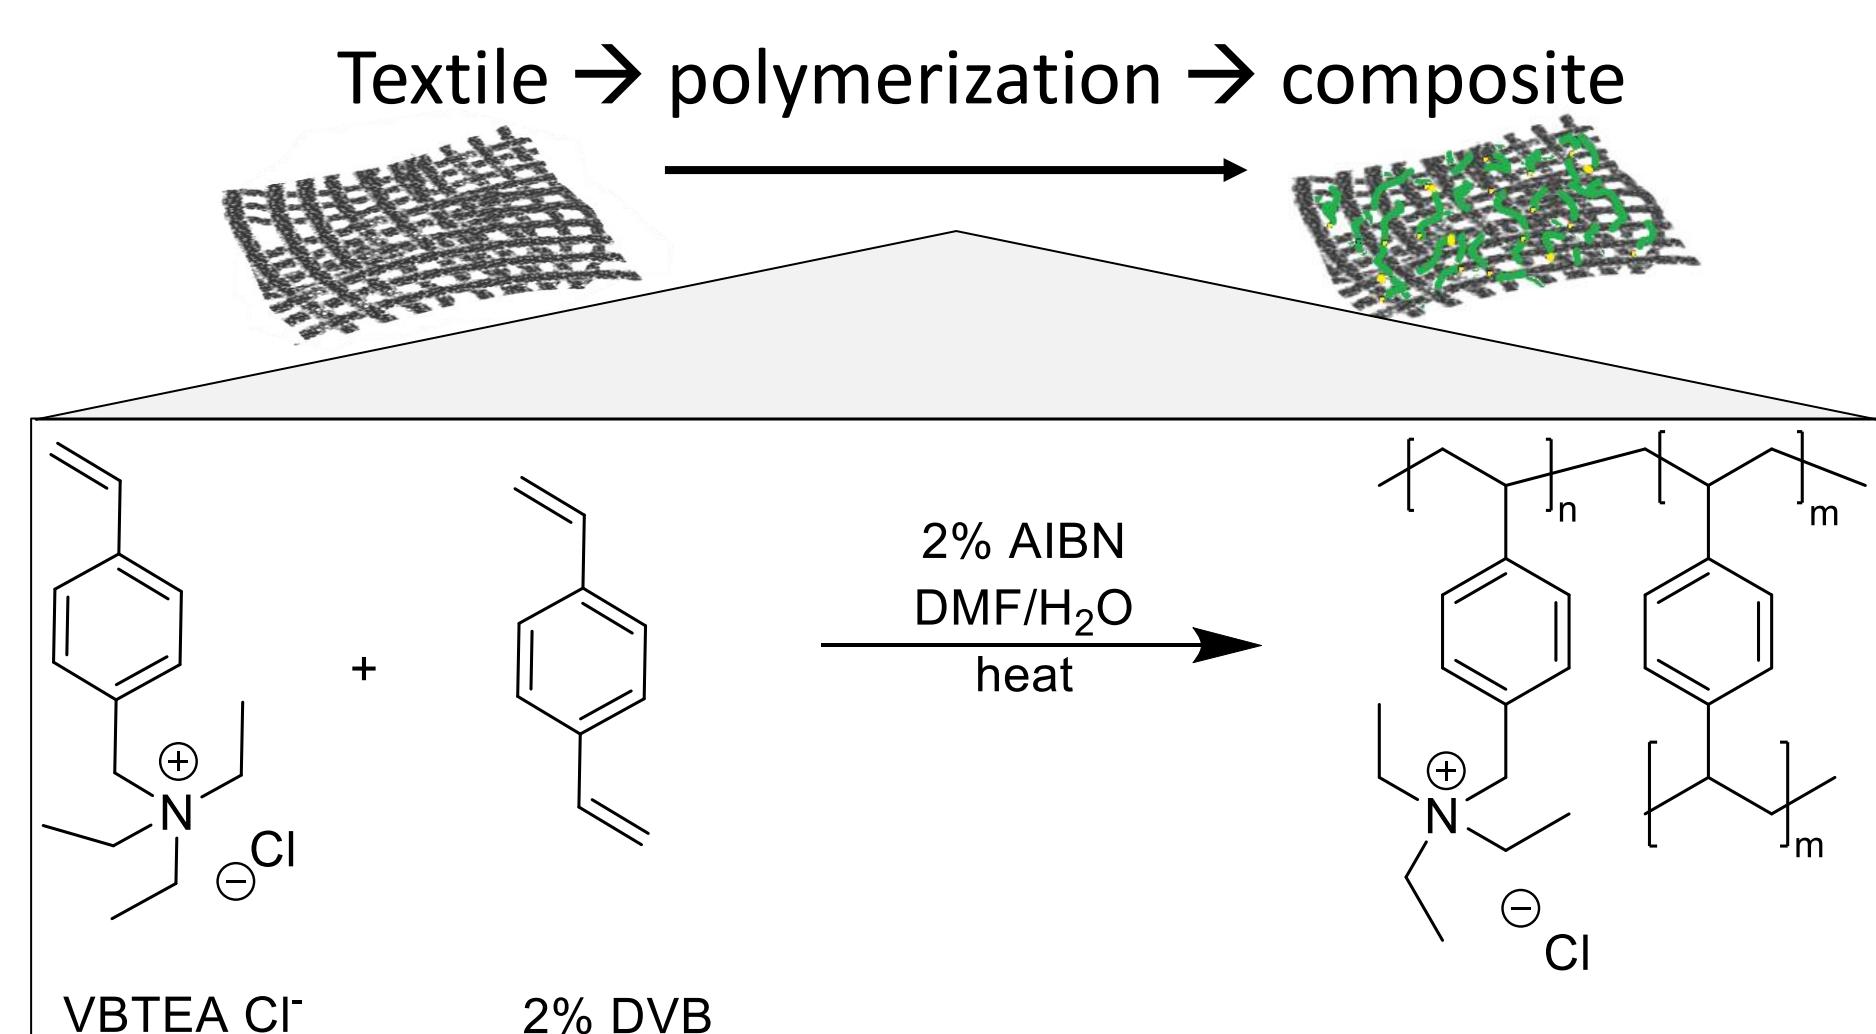

Objective

Synthesize and characterize polymer@textile composites to assess potential for moisture-swing DAC.

Moisture-swing DAC

Membrane synthesis

Modification results

Thickness	
Unmodified	0.180 mm
w/ VBTEA	0.199 mm
w/ VBTEA + DVB	0.246 mm

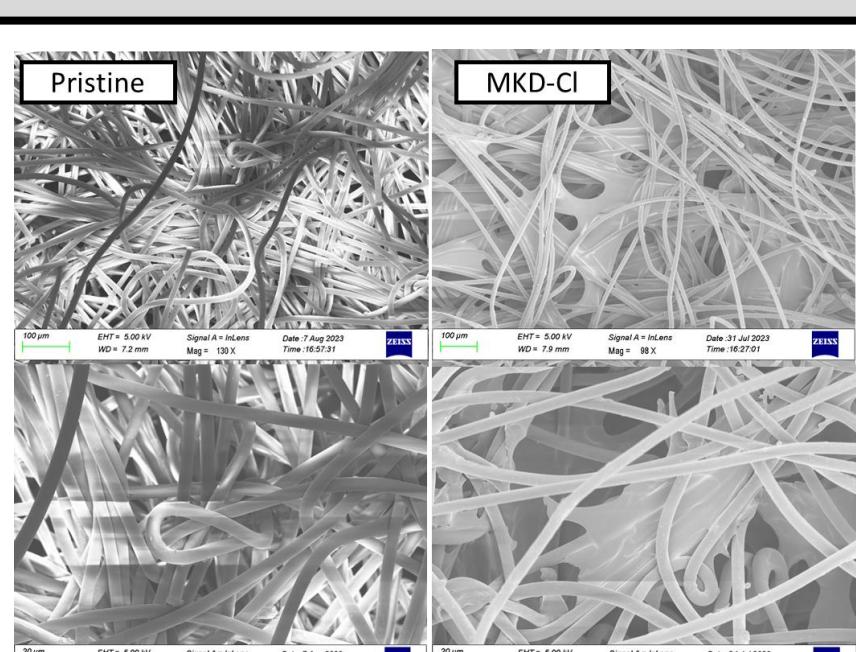

Fig. 3 SEM before and after modification

Acknowledgments

Deepak Akundi, Emmie Bernard, Kacie Niimoto

Characterization

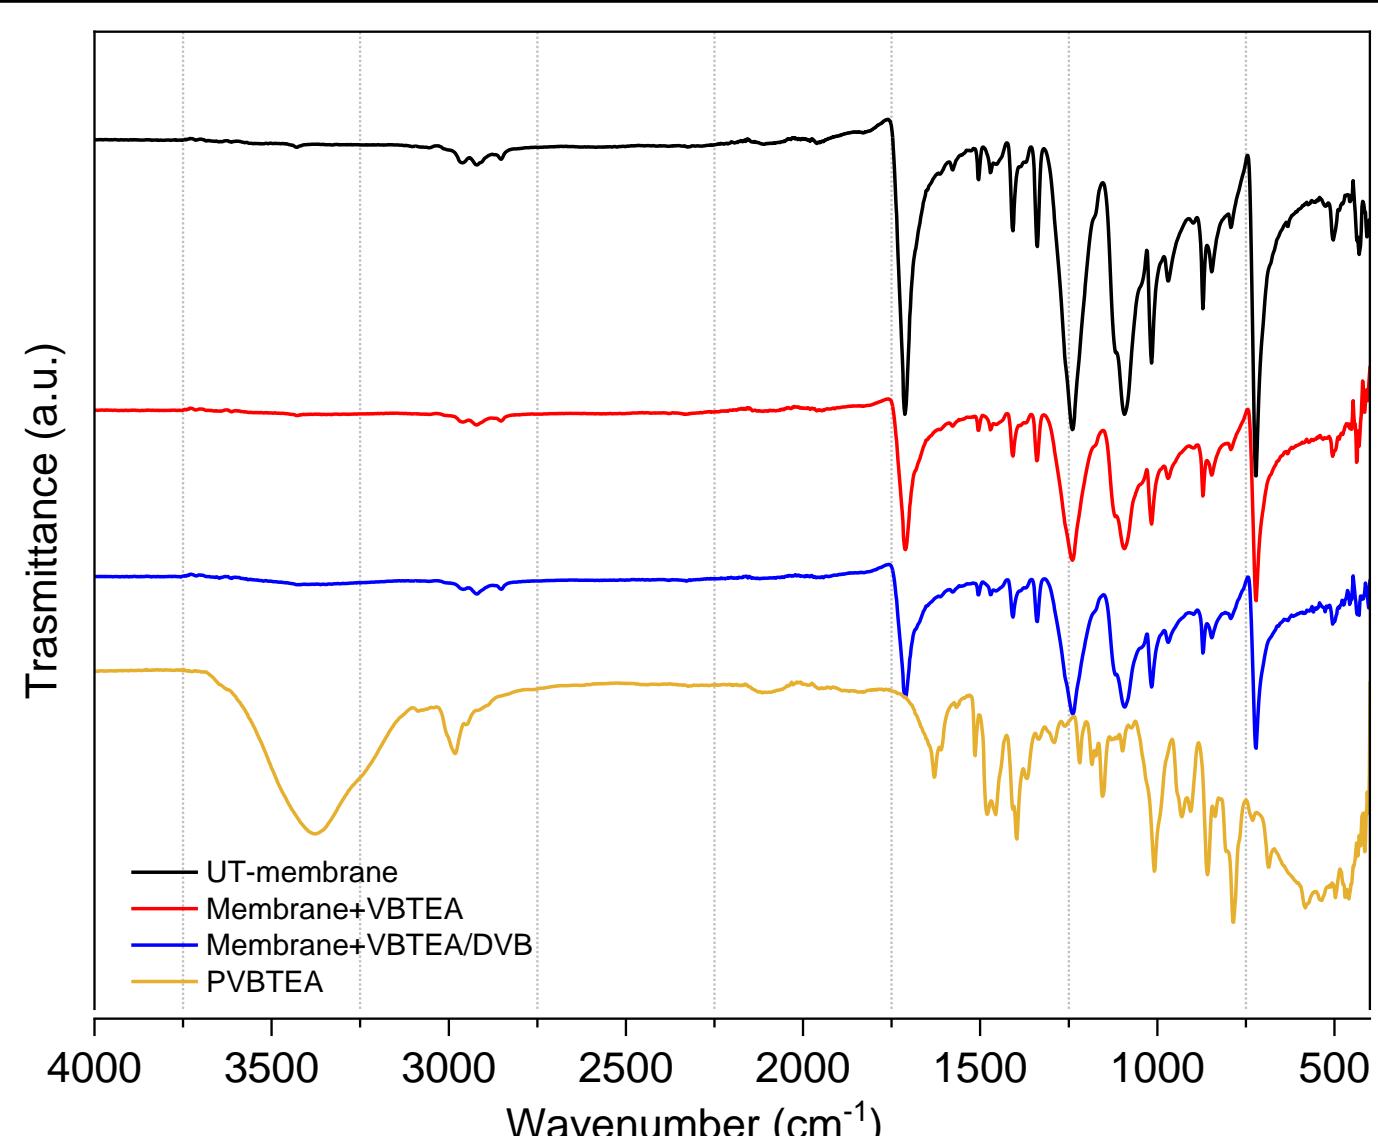

Fig. 4 FTIR spectra for unmodified textile, modified textile with and without crosslinking, and polymer

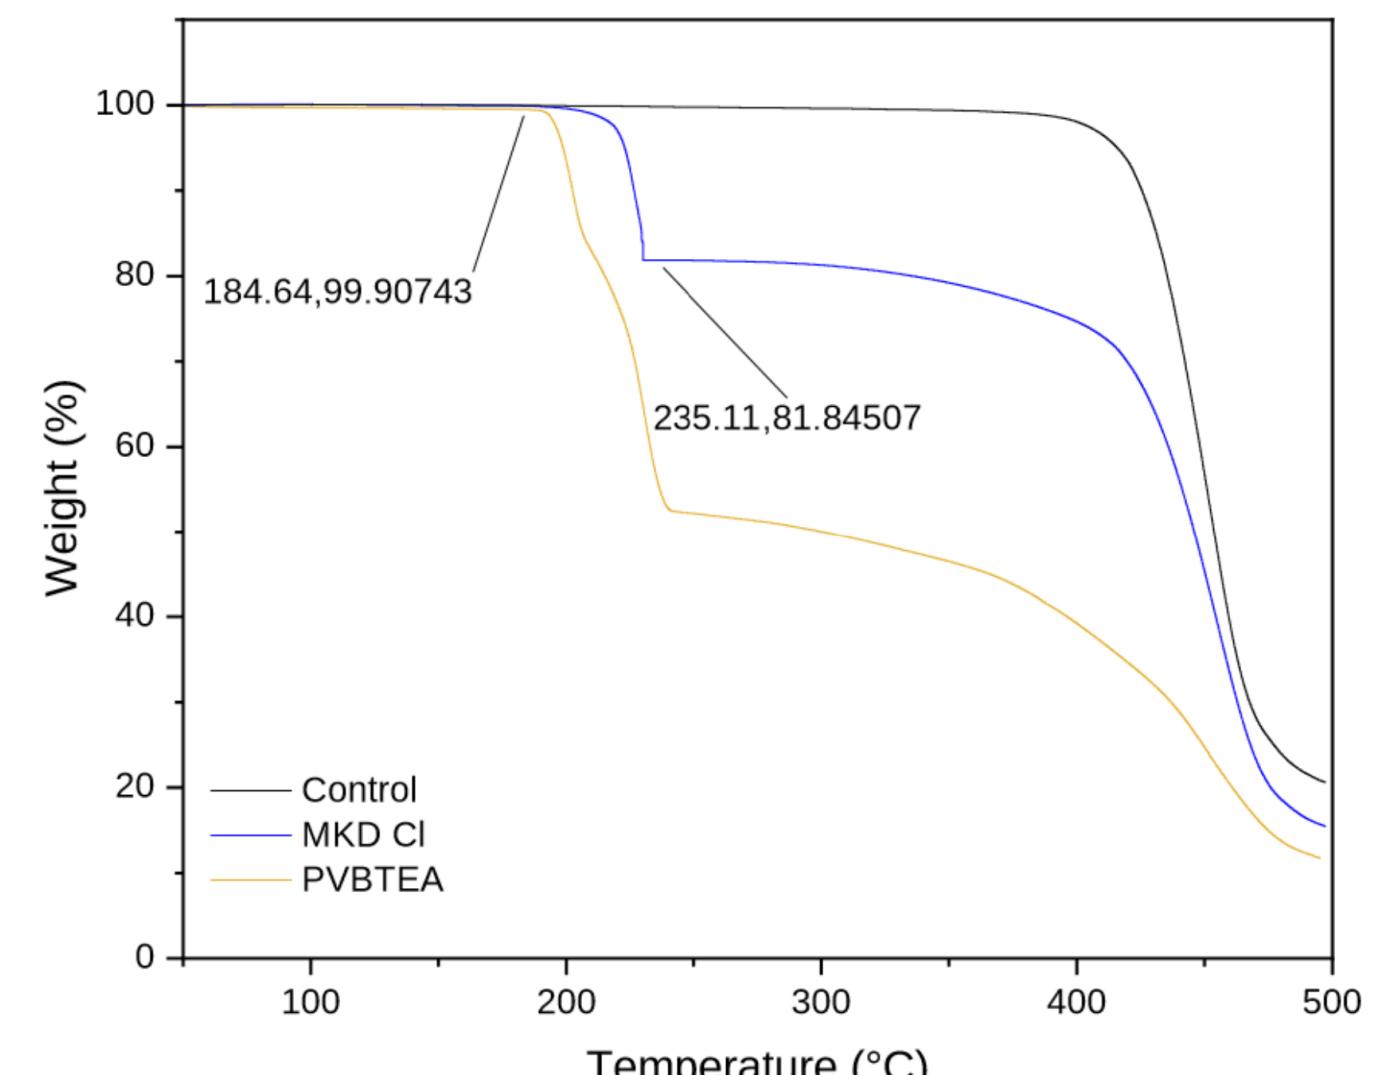

Fig. 5 TGA results for unmodified textile, modified textile, and polymer

DAC results

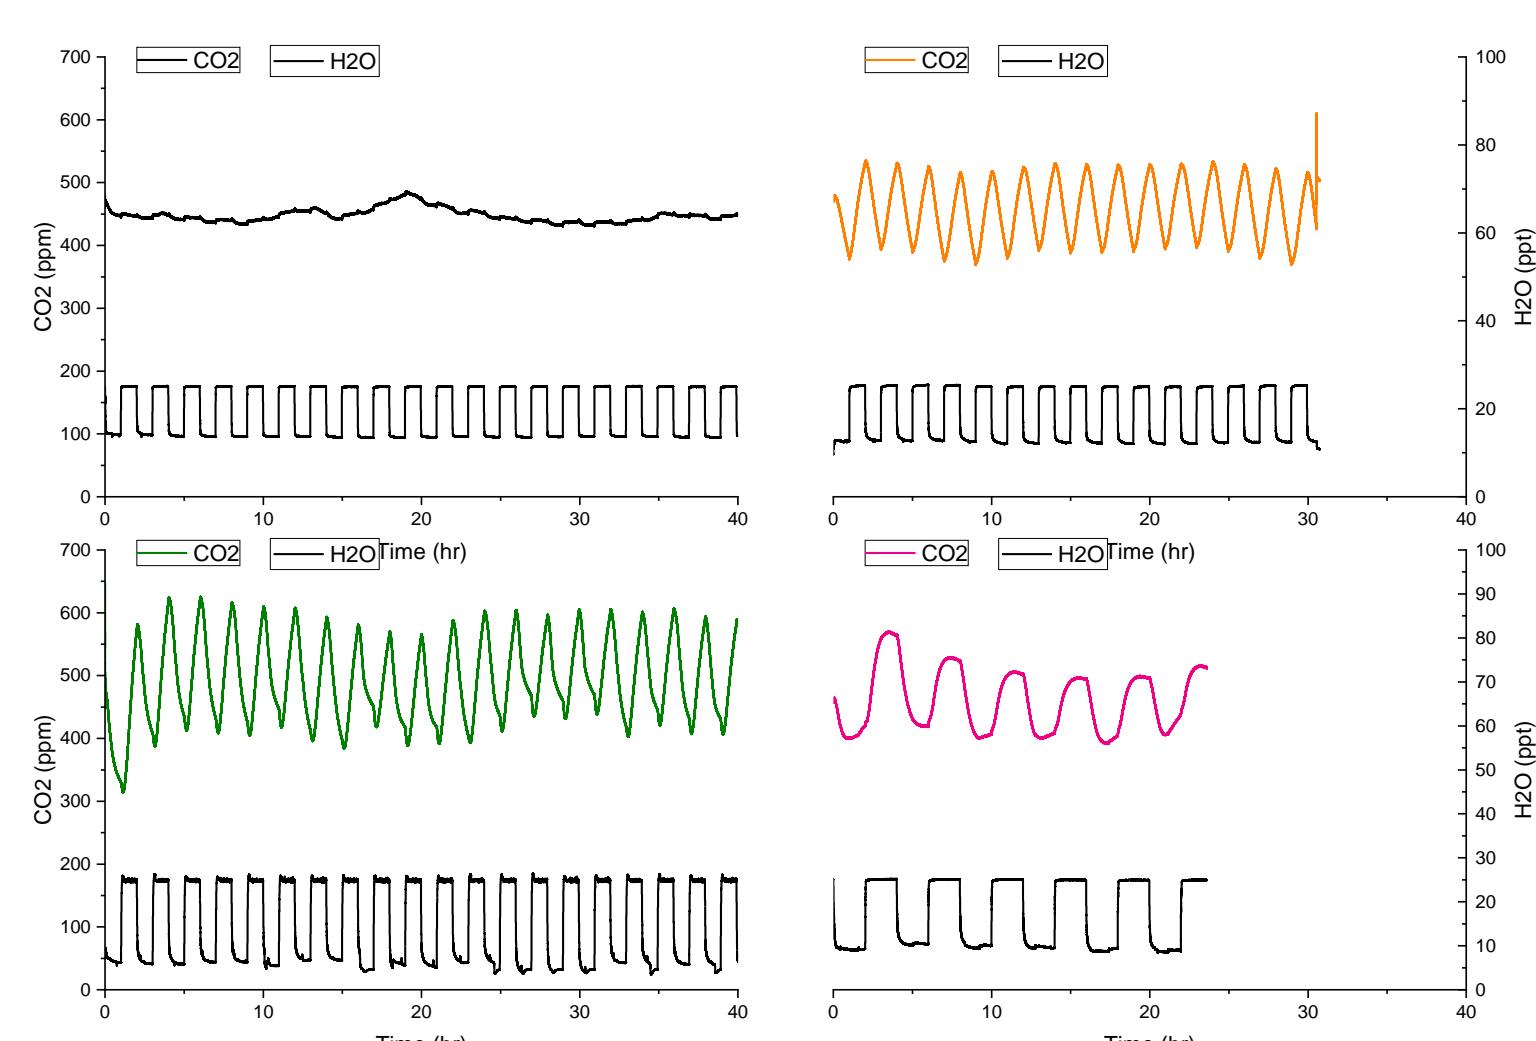

Fig. 6 Moisture-swing DAC results. Clockwise from top left: unmodified, w/ VBTEA, w/ VBTEA + DVB (shorter cycles), and w/ VBTEA + DVB (longer cycles)

Future work

- Develop modification procedure for various textile blends and dyed textiles.
- Investigate sources for textile waste.
